

Sinatra

- Simple SaaS framework
- All params come back as strings

Embedded Ruby (ERB) Files

- End in `.erb`
- Stored in `/views`
- Contain HTML templates
- `< %= @variable %>` (no space between `<` and `%`)
- Can be referenced in ruby with `erb` method and the name of the erb file
- Can define a `layout.erb` file to surround the individual erb files
 - Contains doctype, head, title, etc.
 - Substituted into section of `layout.erb` with `< %= yield %>`

Sessions

- Set and used with `session` dictionary
- Used to store cookies
- Can store anything that can be serializable as a cookie
- ‘leaky’ abstraction, so it’s not foolproof and should keep that in mind
- Maintains all state in the entire site
